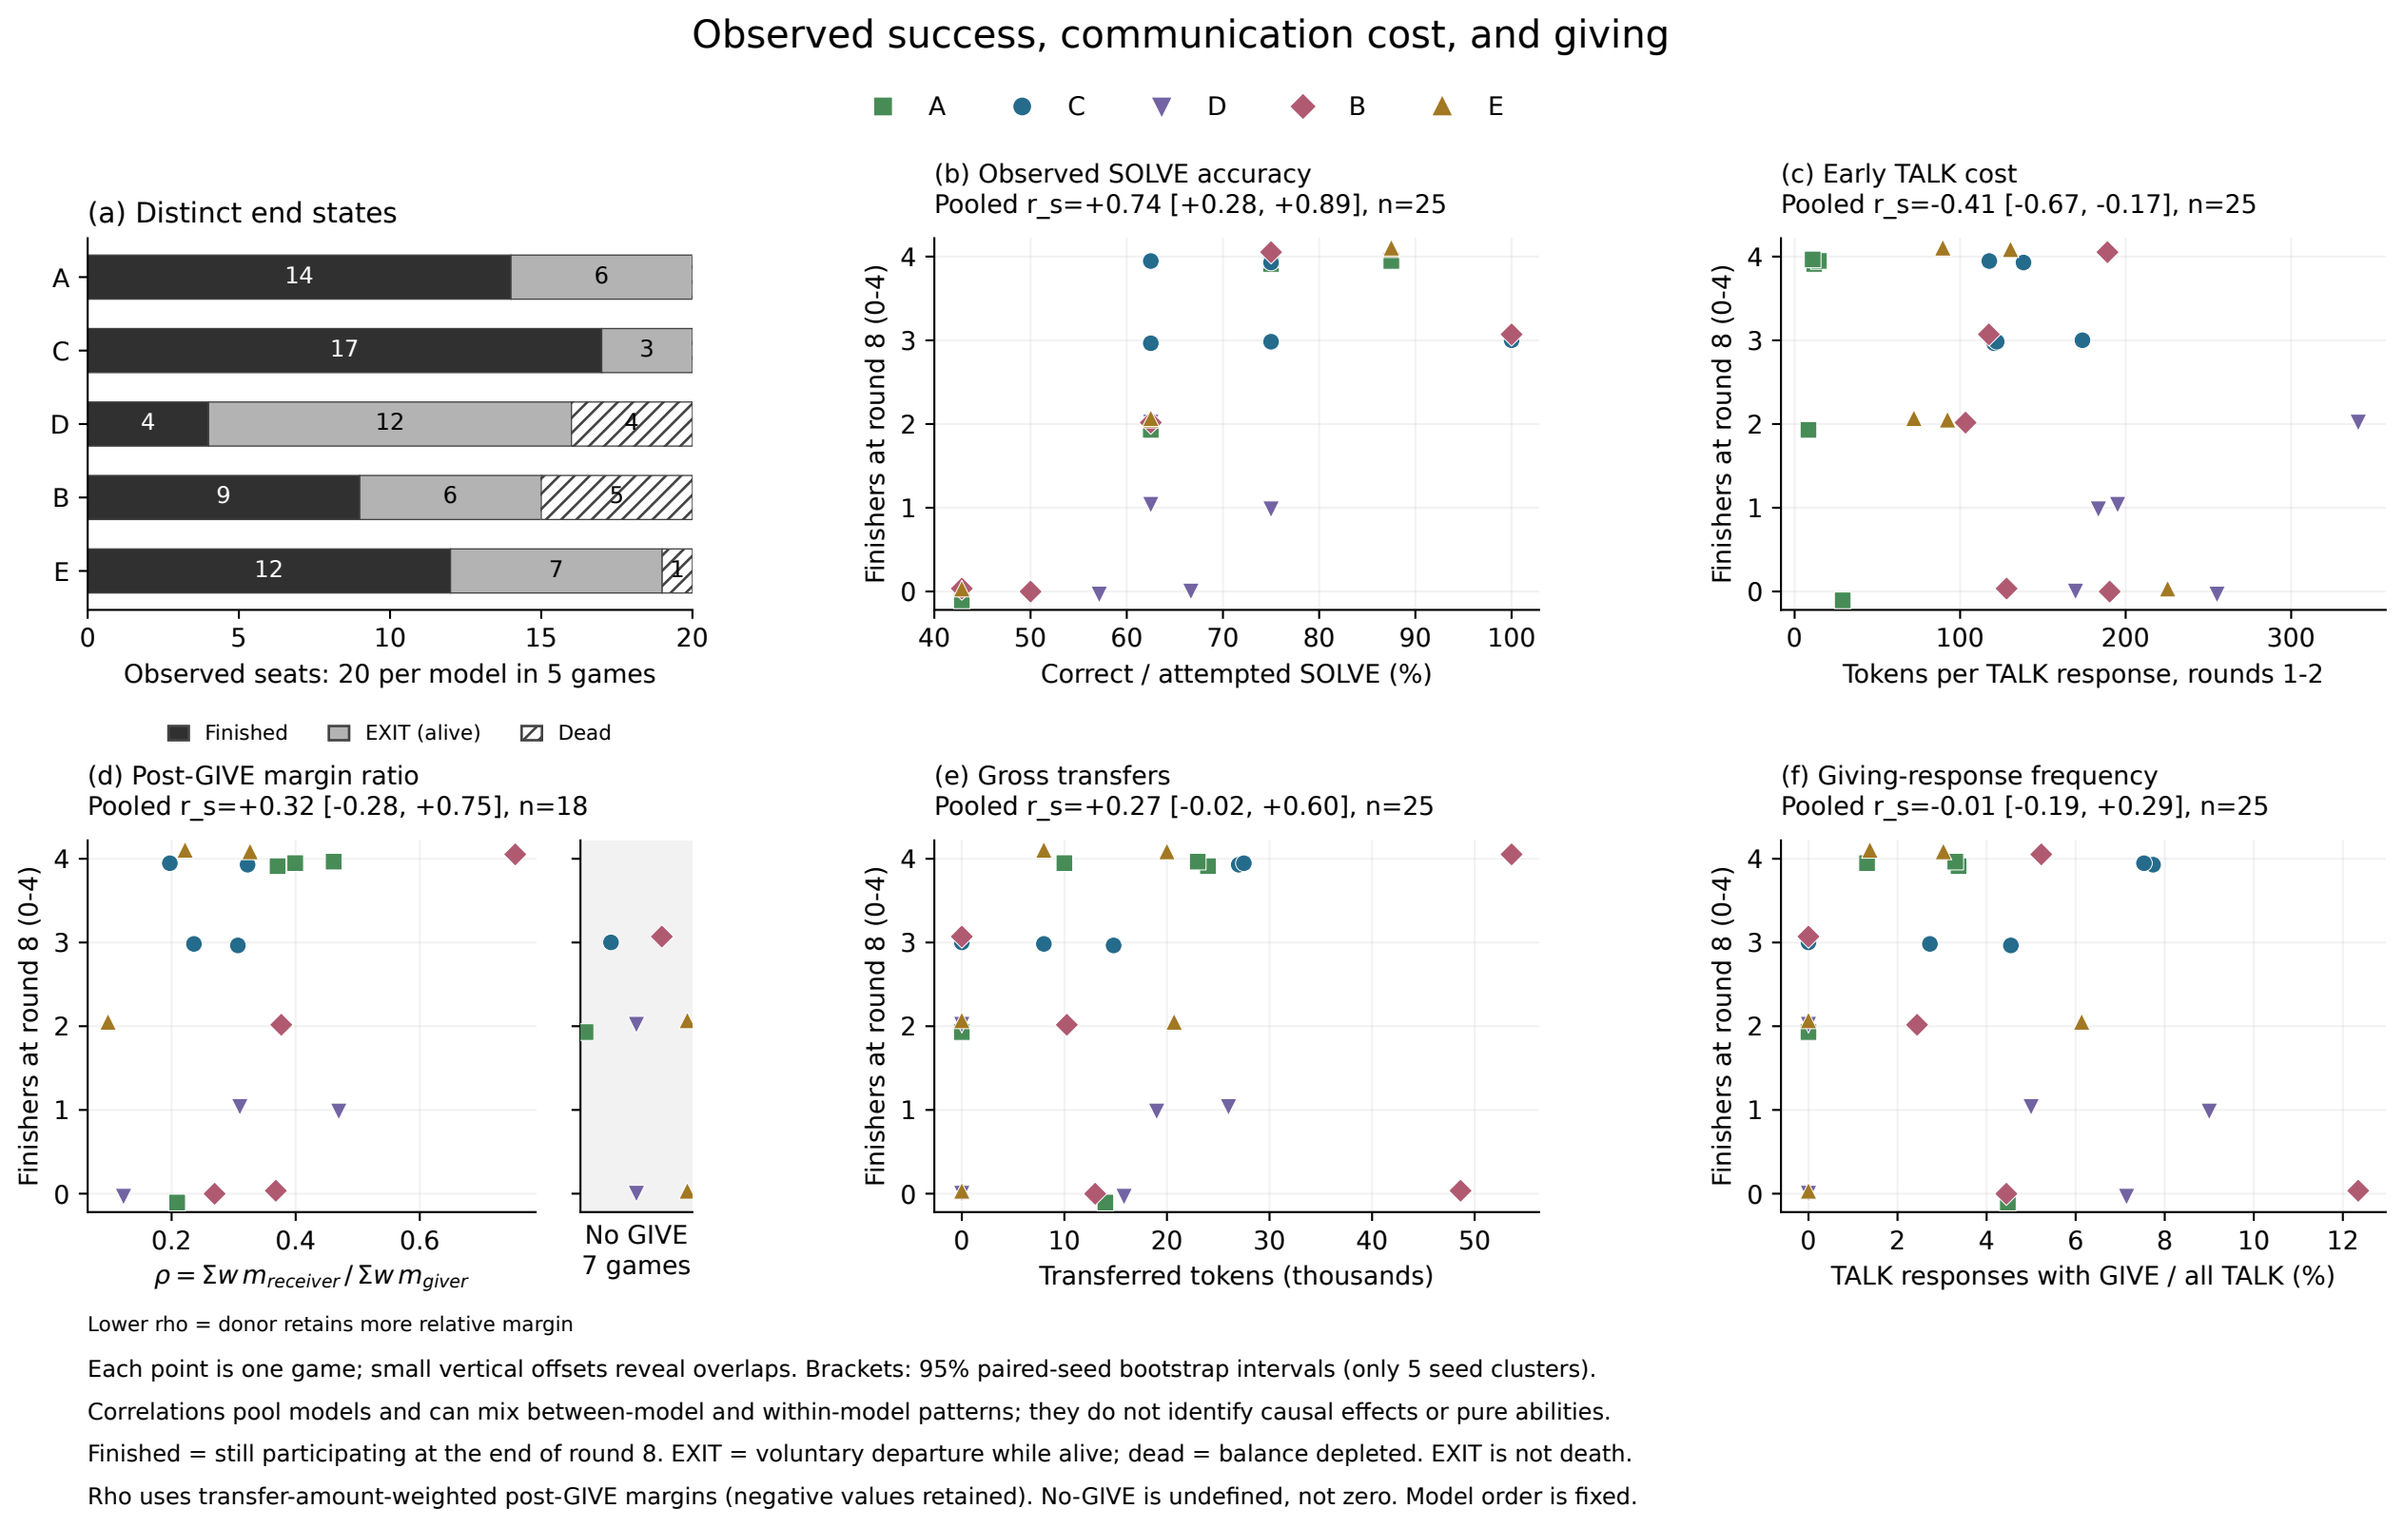
Observed success, communication cost, and giving



Lower rho = donor retains more relative margin

Each point is one game; small vertical offsets reveal overlaps. Brackets: 95% paired-seed bootstrap intervals (only 5 seed clusters).

Correlations pool models and can mix between-model and within-model patterns; they do not identify causal effects or pure abilities.

Finished = still participating at the end of round 8. EXIT = voluntary departure while alive; dead = balance depleted. EXIT is not death.

Rho uses transfer-amount-weighted post-GIVE margins (negative values retained). No-GIVE is undefined, not zero. Model order is fixed.
